

-House Prices Dataset - Ames Housing

-Dataset Description

The data set comprises detailed information on residential houses in Ames, Iowa.

Moreover, it possesses many features related to the physical characteristics of the houses. This includes the type of dwelling, zoning classification, lot size, neighborhood, house type, year of construction, exterior material, basement quality, heating type, garage size, etc.

The dataset comprises several *numerical features* such as LotArea, YearBuilt, and GarageArea, as well as *categorical features*, including MSZoning, Street, each record represents one house sale, with multiple variables influencing market value for the house.

-Problem Statement

The objective of this project is to develop a machine learning model that is able to accurately forecast the *Sale Price* of a house.

It is significant as home prices depend on various factors, and price prediction is important for investment, valuation, and analysis of real estate.

-Machine Learning Task

This is a *supervised learning regression problem*, where:

Input (Features): Characteristics of a house, such as size, location, quality, and condition.

Output (Target): SalePrice (house selling price).

Patterns will be learned by the model based on historical sales data, and it will predict a new house price.

Summary

As In summary, this data set consists of comprehensive information pertaining to houses, and as far as the machine learning objective is concerned, the goal within this project would entail predicting the sale prices of houses.
